

GETTING STARTED WITH RUNDOD · SETUP

One Product, Every Unit

Buy it one way, sell it another, and let the price follow along. Set one product up in three steps.

THE THREE STEPS

1

Every way you sell

The store-wide list of units you count in.

Admin → Product → Units of measure

2

How you stock it

Every product has one base unit.

Base unit = your stocking unit

3

How you sell vs stock

The step that does the real work.

Decimals + conversions + defaults

Step 3, in order

- 1 On **Inventory**, turn on **Allow decimal quantities**. Do this first.
- 2 On **Settings → Units of measure**, open **Unit conversions** and describe each selling unit against your stocking unit.
- 3 In **Defaults**, give each unit its job, then **Save**.

The caulk example**1 EA = 0.0417 CS**

One tube is one of twenty-four in a case. Stock & order by the **Case**; price, sell & transfer by the **Each**.

Price it once: set the price on any one unit and, because every unit is linked back to your stocking unit, the rest price themselves. No math at the counter, and no need to unlink anything.

What's next: rewarding a bulk buy or charging to crack a case open is pricing, and it is the next video.
