

GETTING STARTED WITH RUND00 · HARDWARE SET-UP

Set Up Your Barcode Scanner

One short, one-time setup: pair the scanner, teach it, then test that a scan lands on the ticket.

THREE MOVES, START TO FINISH

1

Pair

Point the scanner at the QR code on the cradle, pull the trigger.

One beep = paired

2

Teach

Print the config sheet, scan the QR at the top of the page.

Wraps scans in I pipes

3

Test

Confirm the wrap, then scan a product into the POS cart.

It lands on the ticket

Set it up in 5 steps

- 1 Plug the cradle's **USB** into the computer.
- 2 Point the scanner at the **QR on the cradle**, pull the trigger.
- 3 Print the config sheet, scan the **QR at the top**.
- 4 Scan into a text box: you want **I0123456789I**.
- 5 In **POS > Transactions > New**, click the cart area (not the search bar), then scan.

The wrap is the whole trick**I0123456789I**

Every good scan comes out inside **pipes**, that's how Rundoo knows a scan is a scan and not typing. Bare number, no bars?
Reprint the sheet and scan it again.

The one thing people miss: print the config sheet on paper. Scanning it off a screen reads unreliably and trips up more folks than anything else in the setup.

Practice away. This is your practice store, so scan a few things to get a feel for it. Scan the same item twice and the quantity climbs instead of adding a new line. None of it touches your real inventory.
